Backing Up Data Using K3B

Step 1. Open k3b
You can find in the Linux menu or type k3b in a terminal

Step 1. Click New Project

Put an empty write-able CD/DVD disc into your CD/DVD Writer. Writing Data to a CD (CD burning) is not difficult with K3b. From the main menu, just click “New Data CD Project” or “New Data DVD Project”.

A new project screen will show up.
On the top left are directories in your computer and on the right is the directory content.
On the below left screen is the project directory. You can change it with another name.
And on the below right is the empty directory. This is the place where you will put all your files.
Step 2. Select and paste the files into project directory.
Now, select any directories or files that you want to copy. In this sample, I will copy all my data from ‘Karate’ directory. I just select the files and drag it into ‘K3b data project’ directory (on the right below).

To start burning process, just click ‘Burn’ button above ‘K3b data project’ directory.

This is the ‘Data Project’ screen.

If you want to change the CD volume, click ‘Filesystem’ TAB and change the volume name. To start the burning process, click ‘Burn’ button.
K3b will start the burning process.

Burning process is ongoing.

Burning process is done. Click ‘Close’ button to finish the current project.
